Please replace the abstract currently on file with the currently amended abstract.

ABSTRACT

This invention relates to an endless elastomeric traction band that is used to propel tracked vehicles [i.e., vehicles which use endless traction bands rather than tires to contact the terrain over which they are driven, e.g., tractors, tanks, bulldozers, etc.] and, more particularly, to the inner surface of such a traction band where lughorn reinforcements are inserted to laterally reinforce the guide lughorns and minimize de-tracking occurrences.
